## About the Developer's Guide

The purpose of this document is to provide a set of instructions, guidelines and technical information needed to interact with the LinksRez Hotel REST API. This is a programmer's guide. The reader should be familiar with the underlying technologies used, including HTML, REST Services and JSON.

Information contained in this document is subject to change. LinksRez will be diligent in notifying you of changes through release notifications.

## Customer Registration

Before using the LinksRez Hotel REST API service, customers must register in the [LinksRez Developer Portal](#). Please use the [signup](#) link to fill in the client registration form. After you submit your data, you will receive a confirmation email and your account will be activated.

On the developer portal you will find [swagger documentation](#) and authentication key that you can find on the [applications page](#).

Upon request you will receive a PDF-file with the detailed instructions about how to use swagger, find the authentication information, and our postman collection, which will help you integrate with the LPA-Hotels smoothly.

**Note:** You will have access to the staging environment. When you complete your integration and testing, you are welcome to request access to the production environment.

## Technical Support

You can contact LinksRez Support by emailing [tech@linksrez.com](mailto:tech@linksrez.com) if you have questions or issues regarding development or production. When contacting LinksRez it is extremely important that you provide your name, company name, email address, telephone number, and a description of the problem, including the exact wording of any error messages and/or console logs.

## Features

The LPA-Hotels REST service provides access to distributed hotel product offerings and associated functionality. This service is intended to be consumed by upstream services such as web-based booking systems. Featured functionality includes:

- Search for hotels by city or latitude/longitude coordinates
- Obtain descriptions, policies, rules and photos of a particular hotel or list of hotels
- Check for room availability of a particular hotel or list of hotels
- Get prices for the available rooms in different rate categories
- Book a hotel room
- Retrieve a booking information
- Cancel a booking

## Supported Endpoints

The LinksRez Hotel REST API service supports the requests listed in the table below. The order, in which they are described here, is the physical life cycle of a complete hotel booking flow.

Table 3. LPA-Hotels Endpoints

Stage	Function	Description	Endpoint	Method
<b>Search</b>	Get hotels by location	Returns a list of hotels around the specified location. Either {latitude/longitude} or {city/state/country} parameters set is mandatory.	/api/v2/hotel	GET
<b>Describe</b>	Get descriptions for a hotel	Obtain description, address, photos, policies, and rules for one hotel.	/api/v2/description	GET
	Get descriptions for hotels	Obtain description, address, photos, policies, and rules for multiple hotels.	/api/v2/description	POST
<b>Offers</b>	Get Offers	Gather availability and pricing for different room types.	/api/v2/offers	GET
	Get Offers Advanced	Alternative way to get availability and pricing, enables advanced queries.	/api/v2/offers	POST
	Best Available Rates	Returns one rate per property, which is the best available rate for the searched dates, guests, and other conditions. Supposed to be called together with “Describe” to display the search results page. Works must be faster than the “all rates” code.	/api/v2/offers	POST
<b>Orders</b>	Create Orders	Create an order at a specific facility for a specific stay date	/api/v2/orders	POST
	Retrieve Order	Retrieve previously created orders	/api/v2/orders	GET
	Modify Orders	Modifies previously created orders	/api/v2/orders	PUT
	Cancel Reservation	Cancel previously created order (if possible)	/api/v2/orders	DELETE

## Workflow

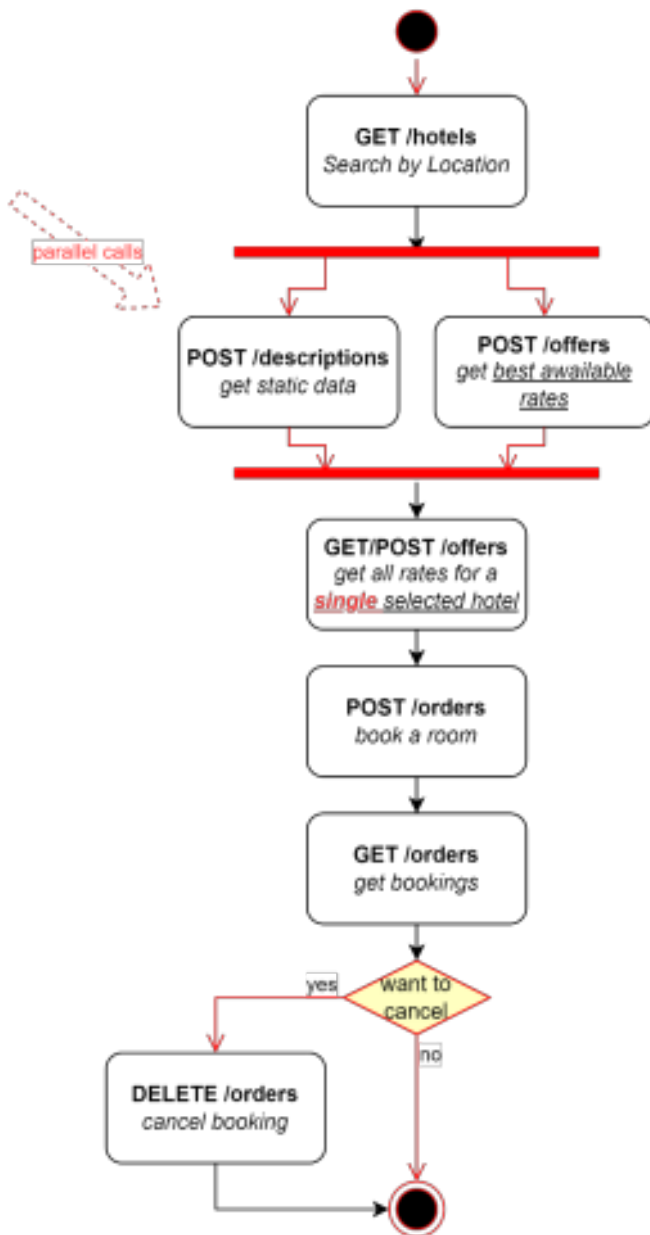

Figure 1. LPA-Hotel Workflow Diagram

### 1. Search Hotels by Location

The first step of the workflow returns the hotels around the searched point.

Refer Find Hotels for more information.

### 2. Get Static Data and Get Best Rates

These 2 endpoints are supposed to be called in parallel to achieve the best performance of data transferring on the client side.

#### **Note: to avoid performance issues!**

The same endpoint POST /offers is used to return the BEST and ALL rates. The difference is described in the parameters set.

Please make sure you are calling the “best-rate” at this point, as to display the search results you need just one price per property. No need to call the slow variation “all rates” of the POST /offers method at this point.

Refer Description and Best Available Rate for more information.

### 3. Get All Offers

If the user selected a hotel to go into details, use this endpoint to get all availability and pricing options.

#### **Note: to avoid performance issues!**

This method supports multiple hotels in the request, and can return all rates for all rooms for all hotels in the request. However, it is strongly recommended to call this method for a few hotels as possible to avoid long-waiting on the client side.

Refer Offers for more information.

### 4. Book a Room

Refer Create Order for more information.

### 5. Get a booking

Returns an order by its ID and client’s last name. Refer Retrieve Order for more information.

### 6. Cancel Booking

Refer Cancel Order for more information.

## Authentication

The LPA-Hotel API is authenticated by an api-key that can be found on the [applications page](#). This key should be sent in the header of each request to the LPA-Hotels.

```
accept: application/json
Accept-Encoding: gzip, deflate, br
Accept-Language: en-US,en;q=0.9
api_key: 1f7ab3c902f3e24a432c13b423f24ea4b
Connection: keep-alive
Host: hotel-api.production.gw.apicast.io
Origin: https://developer.linksrez.com
Referrer: https://developer.linksrez.com/
```

## Endpoint Details

### Search

Get hotels by location - by city

GET	/api/v2/hotel
-----	---------------

### Request

The Find Hotels endpoint is used to search for hotels by location. The endpoint will return a list of hotel codes with simple information about the hotel, including facilityCode, brand, chain, location, and name.

There are currently two options to search for hotels: city, state, country, or latitude/longitude. A specific chain may be searched by specifying the chainCode.

Table 4. Search hotels by city. Request

Name	Required	Type	Description
<b>city</b>	Y	String	City to search in
<b>state</b>	Y	String	Two letter state/province code. If non-US, must be the same as country code
<b>country</b>	Y	String	ISO 3166-1 alpha-2 country code
<b>distanceunit</b>	N	String	Defaults to miles, set to 'km' for kilometers
<b>distance</b>	Y	Integer	Distance (in distance units) from the city center to return results. Take this as the radius of the search circle.
<b>chainCode</b>	N	String	Two letter code of the hotel chains. Leave empty to search all chains.

### Example Request

*Search in Boston, 5 miles from the city center. Hilton only*

/api/v2/hotel?city=Boston&state=MA&country=US&distance=5&distanceunit=M&chainCode=EH

*Search in Paris, 10 km from the city center. All chains*

/api/v2/hotel?city=Paris&state=FR&country=FR&distance=10&distanceunit=km

Table 5. Search hotels by latitude/longitude. Request

Name	Required	Type	Description
latitude	Y	Decimal	Latitude of reference point
longitude	Y	Decimal	Longitude of reference point
distanceunit	N	String	Defaults to miles, set to 'km' for kilometers
distance	Y	Integer	Distance (in distance units) from the city center to return results. Take this as the radius of the search circle.
chainCode	N	String	Two letter code of the hotel chains. Leave empty to search all chains.

## Get hotels by location - by coordinates

### Example Request

#### Search in Paris, 10 km from the point. All chains

/api/v2/hotel?latitude=48.864716&longitude=2.349014&distance=10&distanceunit=km

### Response

The response will contain a FindHospitalityFacilities\_RS message in JSON format. The response contains an array of FacilityHotel objects. The FacilityHotel object contains information about a hotel facility.

Table 6. Search hotels. Response. FacilityHotel

Name		Description
location		The location information of the facility
relativePosition		The information about the distance to the facility from a well-known object(s)
basicPropertyInfo	name	Name of the facility
	code	Unique identifier of the facility in the chain. May repeat in a different chain.
	chainCode	Chain code – should be selected from the pre-defined list of supported chains (look at the swagger file for the exhaustive list of supported chains)
	brandCode	Brand identifier. Usually, two letter code. Should be taken from the response of one of the search endpoints

### Example Response

```
[
  {
    "@type": "FacilityHotel",
    "location": {
      "address": {
        "addressLine": [],
        "bldgRoom": [],

    }
  }
]
```

```

    },
    {
      "@type": "FacilityHotel",
      "location": {
        "address": {
          "addressLine": [],
          "bldgRoom": [],
          "street": "11 Rue d'Astorg",
          "city": "Paris",
          "country": {
            "value": "FR"
          },
          "postalCode": "75008"
        },
        "relativePosition": {
          "distance": "1.46"
        },
        "basicPropertyInfo": {
          "code": "PARAH",
          "name": "Maison Astor Paris, Curio Collection by Hilton",
          "chainCode": "EH",
          "brandCode": "QQ"
        }
      }
    }
  ]
}

```

## Description

### Get descriptions for a hotel

GET

/api/v2/hotel/description

The Description endpoint is used to obtain additional information about the hotels. The information includes verbose description, policies, photos, rules. The GET variation can work with a single hotel at a call.

### Request

Table 7. Get Description of a single hotel. Request

Name	Required	Type	Description
<b>chainCode</b>	Y	String	Chain code – should be selected from the pre-defined list of supported chains (look at the swagger file for the exhaustive list of supported chains)
<b>brandCode</b>	Y	String	Brand identifier. Usually, two letter code. Should be taken from the response of one of the search endpoints
<b>facilityCode</b>	Y	String	The identifier of a particular property/facility/hotel. Unique within its chain. Should be taken from the response of one of the search endpoints.

### Example Request

/api/v2/hotel/description?chainCode=EH&facilityCode=BOSTBT&brandCode=HX

### Response

The response will contain basicPropertyInfo, hotelPropertyInfo, facilityInfo, hotelPolicies, areaInformation, affiliationInfo, multimediaCollection, contactInformation objects in JSON format.

Table 8. Description. Response. HotelPropertyInfo

Name	Description
<b>basicPropertyInfo</b>	Base information such as chain, brand, facilityCode, city and some extra information
<b>hotelPropertyInfo</b>	Hotel 's Amenities.
<b>facilityInfo</b>	Extra rooms and their policies (guests room, meeting rooms, etc.)
<b>hotelPolicies</b>	Hotel Policies, such as checkin and checkout time, pets, smoking rules, etc.
<b>areaInformation</b>	Recreation and other important object available in the area
<b>affiliationInfo</b>	Affiliation Data
<b>multimediaCollection</b>	Verbose description and images
<b>contactInformation</b>	Address and phones

Table 9. Description hotels. Response. BasicPropertyInfo

Name	Description
<b>code</b>	Hotel identifier (unique within a chain). Known also as "facilityCode" and "propertyCode"
<b>name</b>	Full name of the hotel
<b>chainCode</b>	Two letter identifier of the hotel chain
<b>brandCode</b>	Two letter identifier of the brand (a chain may have multiple brands)
<b>cityCode</b>	The code of the city where the hotel is located
<b>extensionPoint</b>	Latitude, longitude, and verbose description of the hotel

Table 10. Description hotels. Response. HotelPropertyInfo.

Name	Description
<b>serviceHotelAmenity</b>	Array of Amenities: meeting rooms, pools, wheelchair access, high-speed internet, etc.
description	Array of strings (text fields) to describe the amenity in details
inventoryCode	The identifier of the amenity
codeDetail	The short description of the amenity

Table 11. Description hotels. Response. FacilityInfo

Name	Description
<b>meetingRooms</b>	Array of meetingRoom objects, with description and policies
<b>guestRooms</b>	Array of guestRoom objects, with description and policies

Table 12. Description hotels. Response. HotelPolicies.

Name	Description
<b>hotelPolicy (array)</b>	hotelPolicyInformation. checkInTime and checkoutTime in YYYY-MM-DD HH:MM A/PM TZ format. The date part is to be ignored (always 1970-01-01)

Table 13. Description hotels. Response. AreaInformation.

Name	Description
<b>recreation (array)</b>	Bi-dimensional array of text blocks to describe the area.

Table 14. Description hotels. Response. AffiliationInfo.

Name	Description
<b>award (array)</b>	Array of text blocks to describe the affiliation

Table 15. Description hotels. Response. MultimediaCollection.

Name	Description
<b>multimedia (array)</b>	Array of textual data and images
textCategory	Array of text objects describing the hotel
imageCategory	Array of image objects, each consist of array of URLs to the images

Table 16. Description hotels. Response. ContactInformation.

Name	Description
<b>address (array)</b>	Array of address objects
<b>telephone (array)</b>	Array of phones of different types (voice, fax, etc.)

## Get descriptions for hotels

POST

/api/v2/hotel/description

The Description endpoint is used to obtain additional information about the hotels. The information includes verbose description, policies, photos, rules. The POST variation can work with multiple hotels at a time.

Table 17. Get Description of multiple hotels. *hotelDescriptionRQArray*. Request.

Name	Required	Type	Description
<b>chainCode</b>	Y	String	Chain code – should be selected from the pre-defined list of supported chains (look at the swagger file for the exhaustive list of supported chains)
<b>brandCode</b>	Y	String	Brand identifier. Usually, two letter code. Should be taken from the response of one of the search endpoints
<b>facilityCode</b>	Y	String	The identifier of a particular property/facility/hotel. Unique within its chain. Should be taken from the response of one of the search endpoints.

## Example Request

```

{
    "hotelDescriptionRQArray": [
        {
            "chainCode": "EH",
            "brandCode": "PY",
            "facilityCode": "CHIJB"
        },
        {
            "chainCode": "EH",
            "brandCode": "HX",
            "facilityCode": "CHITD"
        },
        {
            "chainCode": "EH",
            "brandCode": "DH",
            "facilityCode": "CHINP"
        }
    ]
}

```

```
}
]
}
```

## Response

The response will contain the array of hotelDescriptiveContent objects, which consists of {basicPropertyInfo, hotelPropertyInfo, facilityInfo, hotelPolicies, areaInformation, affiliationInfo, multimediaCollection, contactInformation} objects in JSON format. Every object in the response corresponds to an object in the request.

Table 18. Get Description. Response. HotelDescriptiveContent

Name	Description
<b>hotelDescriptiveContent (array)</b>	Array of {basicPropertyInfo, hotelPropertyInfo, facilityInfo, hotelPolicies, areaInformation, affiliationInfo, multimediaCollection, contactInformation}. See above for more info about each of these subObjects

## Offers

### Get Offers

**GET** /api/v2/hotel/offers

The Offers endpoint is used to get room availability and prices for different room types and various rate schemas. The endpoint will return a list of room types with their pricing options.

Table 19. Get Hotel's offers. Request

Name	Required	Type	Description
<b>chain</b>	Y	String	Chain code – should be selected from the pre-defined list of supported chains (look at the swagger file for the exhaustive list of supported chains)
<b>brand</b>	Y	String	Brand identifier. Usually, two letter code. Should be taken from the response of one of the search endpoints
<b>facility</b>	Y	String	The identifier of a particular property/facility/hotel. Unique within its chain. Should be taken from the response of one of the search endpoints.
<b>start</b>	Y	date	Start of the reservation. Format 'YYYY-MM-DD'. Must be less than end
<b>end</b>	Y	date	End of the reservation. Format 'YYYY-MM-DD'. Must be greater than start
<b>guestcounts</b>	N	Integer	Number of adult guests. Default = 1
<b>roomquantity</b>	N	Integer	Number of rooms. Default = 1

### Example Request

```
/api/v2/hotel/offers?chain=EH&code=FSTGS&start=2022-05-22&end=2022-05-25&roomquantity=2&guestcounts=2
```

### Get Offers Advanced

**POST** /api/v2/hotel/offers

The offers endpoint also can be used in a POST call to enable advanced requests. It allows calling multiple brands, filter by room types, policy options (such as smoking, pets). Also, more complex guest count objects can be used to indicate the number of adults and children. The endpoint will return a list of room types with their pricing options.

### Request

Table 20. POST Hotels' offers. Request. productQueries\_Hospitality.

Name	Required	Type	Description
<b>roomStayQueryProduct</b>	Y	Object	Contains property info, stay dates and guest counts

Table 21. roomStayQueryProduct

Name	Required	Type	Description
<b>basicPropertyInfo</b>	Y	Array	Array of objects, each contains brand, chain and the facility code
<b>baseHospitalityFacilityQuery</b>	Y	Object	Contains the stay dates, guest counts, number of rooms needed and a complex filter

Table 22. basicPropertyInfo\_Detail

Name	Required	Type	Description
<b>name</b>	N	String	Name of the facility. Not used
<b>cityCode</b>	N	String	Identifies the city or area (for some providers)
<b>chainCode</b>	Y	String	Two letter chain identifier
<b>chainName</b>	N	String	The name of the chain. Not used
<b>brandCode</b>	Y	String	Two letters brand identifier
<b>brandName</b>	N	String	Brand name. Not used
<b>code</b>	Y	String	Facility identifier. Unique within the chain

Table 23. baseHospitalityFacilityQuery

Name	Required	Type	Description
<b>dateTimeSpan</b>	Y	Object (date range)	Start and end dates of stay. Date format is YYYY-MM-DD
<b>guestCount</b>	Y	Array	Array of objects that identify guest types and numbers, e.g., number of adults, seniors, children, etc.
<b>rateRange</b>	N	decimal range	Minimum and maximum rates to filter the offers
<b>detailedHotelSearchCriteria</b>	N	Object	Can contain locations that can be used by providers to narrow the number of offers returned. Indicators such as pets allowed, room amenities, and features can be specified
<b>roomTypeCode</b>	N	Object	Provider specific room code
<b>ratePlanCode</b>	N	Object	Provider-specific rate plan to be used for pricing. Not used
<b>numberOfRooms</b>	N	integer	Number of rooms requested. Default = 1

### Example Request

```
{
  "basicPropertyInfo": [{
    "chainCode": "EH",
    "brandCode": "HX",
    "code": "BOSBT"
  }],
  "baseHospitalityFacilityQuery": {
    "dateTimeSpan": {
      "start": "2023-07-15",
      "end": "2023-07-16"
    },
    "detailedHotelSearchCriteria": {
      "petsAllowedInd": "true"
    },
    "guestCount": [
      {
        "ageQualifyingCode": "ADULT",
        "value": "1"
      },
      {
        "ageQualifyingCode": "CHILD",
        "value": "1"
      },
      {
        "ageQualifyingCode": "SENIOR",
        "value": "1"
      }
    ]
  }
}
```

## Response

The response will contain a FindHospitalityFacilities\_RS message in JSON format. The response contains an array of HospitalityOffers objects. The HospitalityOffer object contains information about a hotel facility and the list of offers for that facility.

Table 24. Offers. Response. hospitalityOffers

Name	Description
<b>facilityIdentifier</b>	Contains specific information to identify a facility
<b>Offer</b>	The offer will contain an array of offers that include pricing and room information

Table 25. facilityIdentifier

Name	Required	Type	Description
<b>@type</b>	Y	Constant	"FacilityHotel"
<b>facilityKey</b>	Y	object	The unique identifier of the facility

Table 26. facilityKey

Name	Required	Type	Description
<b>@type</b>	Y	Constant	"FacilityKeyHotel"
<b>facilityCode</b>	Y	String	The identifier of a particular property/facility/hotel. Unique within its chain. Should be taken from the response of one of the search endpoints.
<b>chainCode</b>	Y	String	Two letter code of the hotel chains. Leave empty to search all chains.

Table 27. Offers. Response. Offer

Name	Description
<b>TotalPrice</b>	Specific rate information
<b>Product</b>	Specific room information
<b>TermsAndConditions</b>	Guarantee requirements and deposit information

```

### Multiple Properties Offers Call

The POST variation of the Offers endpoint supports multiple hotels in the request. BasicPropertyInfo is an array of property objects, where an object represents a property being called. Sending multiple items in the array is the way of obtaining offers from several hotels:

```

{
    "basicPropertyInfo": [
        {
            "chainCode": "EH",
            "brandCode": "HX",
            "code": "BOSBT"
        },
        {
            "chainCode": "EH",
            "brandCode": "GI",
            "code": "BOSLO"
        },
        {
            "chainCode": "EH",
            "brandCode": "HH",
            "code": "BOSLH"
        }
    ],
    "baseHospitalityFacilityQuery": {
        "dateTimeSpan": {
            "start": "2022-07-15",
            "end": "2022-07-16"
        },
        "detailedHotelSearchCriteria": {
            "petsAllowedInd": "true"
        },
        "guestCount": [
            {
                "ageQualifyingCode": "ADULT",
                "value": "1"
            }
        ]
    }
}

```

## Best Available Rate

**POST** /api/v2/hotel/offers

This is exactly the same endpoint as the previous use. To get only the best rate per property, please specify the following parameter in the request:

```
{
  "extensionPoint": {
    "any": [{"cheapestRate": true}]
  }
}
```

Please refer to the previous section (Offers) for the details of the request and response parameters.

### Example Request

```
{
  "basicPropertyInfo": [
    {"chainCode": "EH", "code": "BOSBT"},
    {"chainCode": "EH", "code": "BOSLO"}
  ],
  "baseHospitalityFacilityQuery": {
    "dateTimeSpan": {
      "start": "2024-03-15",
      "end": "2024-03-20"
    },
    "guestCount": [
      {
        "ageQualifyingCode": "ADULT",
        "value": "1"
      }
    ]
  },
  "extensionPoint": {
    "any": [{"cheapestRate": true}]
  }
}
```

### Example Response

```
{
  "offers": [
    {
      "product": [
        {
          "@type": "ProductHospitality",
          "roomStay": {

## Orders

### Create Order

**POST** /api/v2/hotel/order

POST orders request creates a new order, i.e. books room(s) at a hotel facility. If the order cannot be created the response will contain an appropriate explanation/error message. If the order requires a deposit and no payment information is provided, the order will not be processed and will be rejected with the proper error message.

#### Request

Table 28. Create Order. Request. createOrderRQ.

Name	Required	Type	Description
<b>payloadStdAttributes</b>	N	Object	Payload Standard Attributes object.
<b>order</b>	Y	Object	Order information

Table 29. payloadStdAttributes

Name	Required	Type	Description
<b>target</b>	Y	String	TEST or PRODUCTION.
<b>version</b>	Y	String	Current version is "5.000"
<b>transactionStatusCode</b>	Y	String	Indicates start or end of the transaction. Should be "START".
<b>retransmissionIndicatorInd</b>	Y	Boolean	False for the first request for an order. True is the order is retransmitted
<b>transactionIdentifier</b>	Y	String	Random unique string to identify the transaction for the client

Table 30. Order

Name	Required	Type	Description
<b>offer</b>	Y	Array	Array of offers. Each offer is an object from GET/POST offers response. See <a href="#">[Offers]</a> for more details. The only difference is that dateTimeSpan must be outside of roomStay. (see highlight below)
<b>primaryTraveler</b>	Y	Object	Name and contacts of the primary traveler.
<b>payment</b>	Y	Array	Array of payment options. Multiple options can be specified.

Table 31. primaryTraveler

Name	Required	Type	Description
<b>personName</b>	Y	Object	Specifies the surname and given name. Given name is an array, which enables complex names.
<b>Address</b>	Y	Object	Specifies the address city, state/prov, country, and postal code.
<b>Telephone</b>	Y	Array	Array of telephone numbers with their types (work/home/mobile, etc.)
<b>Email</b>	Y	Array	Array of email addresses with their types (work/home etc.)

Table 32. payment

Name	Required	Type	Description
<b>formOfPayment</b>	Y	Array	An array of FormOfPayment Objects that can be of several different types. Typically would be either FormOfPayment_PaymentCard or FormOfPayment_DirectBill

Table 33. formOfPaymentBase Type. Parent for paymentCard, directBill and others

Name	Required	Type	Description
<b>guaranteeTypeCode</b>	Y	String	Payment Guarantee type code. Includes Credit Card (CC/GCC), Direct Bill, Prepayment and others. Should be taken from the options in GET/POST offers response

Table 34. formOfPayment\_PaymentCard

Name	Required	Type	Description
<b>paymentCard</b>	Y	Object	Credit/Debit card data

Table 35. paymentCard

Name	Required	Type	Description
<b>cardCode</b>	Y	String	Two letter credit card code: VI/MC/ etc.
<b>cardHolderName</b>	Y	String	Card holder name
<b>cardNumber</b>	Y	String	EncryptionTyen object that has a plaintext property to hold the card number
<b>seriesCode</b>	Y	String	EncryptionTyken object that has a plain text property to hold the series code
<b>expireDate</b>	Y	MMYY	4 digits, defining the number of the month (01-12) and year (YY) – the expiration date.

Table 36. formOfPayment\_DirectBill

Name	Required	Type	Description
directBill	Y	Object	Direct Bill account information

Table 37. directBill

Name	Required	Type	Description
directBill_ID	Y	String	The bill identifier
billingAccount	Y	String	Billing Account number

## Example Request

}

```

## Response

The response will contain a CreateOrder\_RS message in the JSON format. The response contains a reservation object, which includes the list of Orders with ConfirmationId and optionally ReservationID, and pricing information.

Table 38. createOrder. Response. createOrder\_RS

Name	Description
<b>payloadStdAttributes</b>	Payload Standard Attributes object. See [Table 29. payloadStdAttributes] for more details.
<b>result</b>	Errors, warning and request status message.
<b>order</b>	The order will contain an array of offers that include pricing and room information. Full copy of the Order objects from the request plus Confirmation and optional Reservation identifiers.

Table 39. Confirmation and Reservation identifiers

Name	Description
<b>confirmationID</b>	The primary identifier of successful booking. This field is always present if the booking succeeded. <pre> "confirmationID": {   "value": "6948984648" } </pre>
<b>reservationID</b>	Some chains also return reservationID, which is required for order cancellation. This identifier is returned in ExtensionPoint object: <pre> "extensionPoint": {   "any": [     {       "gnrNumber": "62599742"     }   ] } </pre>

Table 40. Offer. Is included in the Order object. Full copy of the object from the request

Name	Description
<b>totalPrice</b>	Contains the order's total pricing information and can contain product price information and taxes
<b>termsAndConditions</b>	Cancellation and Guarantee Policies for the stay
<b>product</b>	The Product_Hospitality object contains the room stay, guest counts, and the date and time span for the stay.

Table 41. totalPrice

Name	Description
<b>total</b>	The total cost of the entire stay
<b>productPrice</b>	The productPrice_Hospitality object contains the list of room rates and can contain tax information
<b>taxes</b>	List any taxes that might be included in the total price

Table 42. productPrice\_Hospitality

Name	Description
<b>roomRate[]</b>	The array of room rates that make the complete room stay up.
<b>amount</b>	The amount contains a value that is the one day stay price with tax
<b>taxes</b>	List any taxes that might be included in the total price

Table 43. Taxes

Name	Description
<b>total</b>	Contains the sum of all taxes expressed as a decimal value, in the property's currency.
<b>tax</b>	Can contain the list of all the individual taxes

Table 44. termsAndConditions

Name	Description
<b>cancelPenalty</b>	Lists any policies for canceling the stay
<b>guaranteePolicy</b>	Lists any guarantees that apply to the stay

Table 45. cancelPenalty

Name	Description
<b>deadline</b>	An absolute or relative deadline for the cancellation if available
<b>amountPercent</b>	The % of the cancel penalty, from the total price
<b>description</b>	A textual description of the cancel policy

Table 46. guaranteePolicy

Name	Description
<b>type</b>	Defines the guarantee to be applied to the reservation
<b>guaranteePolicyType</b>	Defines the policy applied to the booking restrictions
<b>deadline</b>	An absolute or relative deadline if available
<b>comment</b>	Textual comments
<b>description</b>	Textual description of the policy
<b>graranteeAccepted</b>	Describes the forms of guarantee that are accepted
<b>depositPolicy</b>	Describes any policies for a deposit requirements

Table 47. product\_Hospitality

Name	Description
<b>roomStay</b>	Room type and Rate plan
<b>dateTimeSpan</b>	The arrival and departure dates for the stay

Table 48. roomStay

Name	Description
<b>roomType</b>	Chain specific room type code and description
<b>ratePlan</b>	Chain specific rate plan code and description. Determines the cost of the room.

```

## Retrieve Order

**GET** /api/v2/hotel/order

The GET command to the order endpoint is used to retrieve the information about the order identified by the parameters.

### Request

Table 49. Get Order. Request

Name	Required	Type	Description
<b>chainCode</b>	Y	String	Chain code – should be selected from the pre-defined list of supported chains (look at the swagger file for the exhaustive list of supported chains)
<b>confirmationId</b>	Y	Long Integer	The identifier of the order in the chain.
<b>Surname</b>	Y	String	The last name of the primary traveler.

### Example Request

/api/v2/hotel/order?chainCode=EH&confirmationId=98104745&surname=Johnson

### Response

The response will contain the CreateOrder\_RS message in the JSON format. The response contains a reservation object, which includes the list of Orders with ConfirmationId and optionally ReservationID, and pricing information. For more information please refer to the Create Order Response.

## Change Order

**PUT** /api/v2/hotel/order

The PUT command to the order endpoint is used to change an existing order. The request and response are identical to the Best Available Rate, but the request must have the confirmationID.

## Cancel Order

**DELETE** /api/v2/hotel/order

DELETE orders request invokes order cancellation. If the order is not cancellable, an appropriate error message will return. In the case of success, the orderCancellationID will be returned in the response.

DELETE orders can cancel one or more orders. deleteOrderRQ is an array that can contain multiple objects of the same structure.

## Request

Table 50. Create Order. Request. deleteOrderRQ.

Name	Required	Type	Description
<b>payloadStdAttributes</b>	Y	Object	Payload Standard Attributes object.
<b>order</b>	Y	Object	Order information

Table 51. payloadStdAttributes

Name	Required	Type	Description
<b>target</b>	Y	String	TEST or PRODUCTION.
<b>version</b>	Y	String	Current version is "5.000"
<b>primaryLangID</b>	Y	String	EN is the only supported yet
<b>echoToken</b>	N	String	Random string
<b>timeStamp</b>	Y	TimeStamp	Current timestamp YYYY-MM-DDTHH:mm:ss
<b>transactionStatusCode</b>	Y	String	Indicates start or end of the transaction. Should be "START".
<b>retransmissionIndicatorInd</b>	Y	Boolean	False for the first request for an order. True is the order is retransmitted
<b>transactionIdentifier</b>	Y	String	Random unique string to identify the transaction for the client

Table 52. order

Name	Required	Type	Description
<b>offer</b>	Y	Array	Array of offers to be canceled. Some chains support partial Order cancellation, thus if the order includes several rooms (offers), then a subset of those can be in the request. <b>Note:</b> at this point LPA does not support partial order cancellation even if the hotelChain does.
<b>primaryTraveler</b>	Y	Object	Name and contacts of the primary traveler.
<b>confirmationID</b>	Y	Object	Confirmation ID object
<b>extensionPoint</b>	Y	Object	Used to provide the reservation ID for some chains. If CREATE Order returned reservationID, then DELETE Order requires this value in the extensionPoint. Otherwise, the reservationID is not needed.

Table 53. offer

Name	Required	Type	Description
<b>facilityIdentifier</b>	Y	Object	Contains specific information to identify a facility

Table 54. facilityIdentifier

Name	Required	Type	Description
<b>@type</b>	Y	Constant	"FacilityHotel"
<b>facilityKey</b>	Y	object	The unique identifier of the facility

Table 55. facilityKey

Name	Required	Type	Description
@type	Y	Constant	"FacilityKeyHotel"
facilityCode	Y	String	The identifier of a particular property/facility/hotel. Unique within its chain. Should be taken from the response of one of the search endpoints.
chainCode	Y	String	Two letter code of the hotel chains. Leave empty to search all chains.

Table 56. primaryTraveler

Name	Required	Type	Description
personName	Y	Object	Contains the name of the primary traveler
surname	Y	String	The last name of the primary traveler

Table 57. confirmationID

Name	Required	Type	Description
Value	Y	String	The confirmationID of the order. Was retrieved from CREATE Order response

Table 58. extensionPoint

Name	Required	Type	Description
any	Y	Array	Array of any object
gnrNumber	Y	Long Int	reservationID. If the reservationID was not returned in the CREATE Order response, then the entire ExtensionPoint object is not needed. Otherwise, the reservationID is required.

## Response

The response will contain deleteOrder\_RS message in the JSON format. The response contains an orderID with confirmationID and cancellationID. The latter is important in case we need to prove the order had been canceled.

If the DELETE order call was executed for more than one order, deleteOrder\_RS will contain multiple objects for each order canceled.

Table 59. deleteOrderRS

Name	Description
<b>order</b>	Defines the order (by confirmationID) and the ID of the cancellation (cancellationID).

Table 60. DeleteOrders. order

Name	Description
<b>confirmationID</b>	The primary identifier of successful booking. This field is always present if the booking succeeded. <pre>"confirmationID": {   "value": "6948984648" }</pre>
<b>cancellationID</b>	The ID of the cancellation record. May be needed to confirm that the order had been canceled: "cancellationID": { "value": "21525430" }

## Example Response

```
{  
  "deleteOrderRS": [  
    {  
      "order": {  
        "confirmationID": {  
          "value": "91763289"  
        },  
        "cancellationID": {  
          "value": "24208230"  
        }  
      }  
    }  
  ]  
}
```
